

ABSTRACT

A disc brake (10) is described, having two brake shoes (12, 14), which for generating a clamping force (A, A') are pressable against both sides of a brake disc (16), and an
5 actuator device (26) for actuating at least one of the brake shoes (12, 14). The disc brake comprises a force transducer (42) e.g. in the form of a force sensor, which is disposed in a first force transmission path (C) between the actuator device (26) and at least one of the brake shoes (12, 14).
